

PART - B SOLVED PROBLEMS

1. Convert the given regular expression $(a|b)^*abb(a|b)^*$ into NFA using Thompson construction and then to minimized DFA. (APR/May 2010)

Solution:

- i) Convert the expression into NFA using Thompson construction.

- ii) Convert the NFA into a DFA by eliminating ϵ -transitions.

Find the ϵ -closure of all the states

- ϵ -closure(1) = {1,2,3,5,8}
 ϵ -closure(2) = {2,3,5}
 ϵ -closure(3) = {3}
 ϵ -closure(4) = {2,3,4,5,7,8}
 ϵ -closure(5) = {5}

$$\epsilon\text{-closure}(6) = \{2,3,5,6,7,8\}$$

$$\epsilon\text{-closure}(7) = \{2,3,5,7,8\}$$

$$\epsilon\text{-closure}(8) = \{8\}$$

$$\epsilon\text{-closure}(9) = \{9\}$$

$$\epsilon\text{-closure}(10) = \{10\}$$

$$\epsilon\text{-closure}(11) = \{11,12,13,14,16,19\}$$

$$\epsilon\text{-closure}(12) = \{12,13,14,16,19\}$$

$$\epsilon\text{-closure}(13) = \{13,14,16\}$$

$$\epsilon\text{-closure}(14) = \{14\}$$

$$\epsilon\text{-closure}(15) = \{13,14,15,16,18,19\}$$

$$\epsilon\text{-closure}(16) = \{16\}$$

$$\epsilon\text{-closure}(17) = \{13,14,16,17,18,19\}$$

$$\epsilon\text{-closure}(18) = \{13,14,16,18,19\}$$

$$\epsilon\text{-closure}(19) = \{19\}$$

Let the initial state be the ϵ -closure (initial state)

$$\epsilon\text{-closure}(1) = \{1,2,3,5,8\} \quad \dots\dots A$$

$$\begin{aligned} \text{Move}(A, a) &= \epsilon\text{-closure}(\hat{\delta}(A, a)) \\ &= \epsilon\text{-closure}(4, 9) \\ &= \{2,3,4,5,7,8,9\} \quad \dots\dots B \end{aligned}$$

$$\begin{aligned} \text{Move}(A, b) &= \epsilon\text{-closure}(\text{Move}(A, b)) \\ &= \epsilon\text{-closure}(6) = \{2,3,5,6,7,8\} \quad \dots\dots C \end{aligned}$$

$$\begin{aligned} \text{Move}(B, a) &= \epsilon\text{-closure}(\text{Move}(B, a)) \\ &= \epsilon\text{-closure}(4, 9) = \{2,3,4,5,7,8,9\} \quad \dots\dots B \end{aligned}$$

$$\begin{aligned} \text{Move}(B, b) &= \epsilon\text{-closure}(\text{Move}(B, b)) \\ &= \epsilon\text{-closure}(6, 10) = \{2,3,5,6,7,8,10\} \quad \dots\dots D \end{aligned}$$

$$\begin{aligned} \text{Move}(C, a) &= \epsilon\text{-closure}(\text{Move}(C, a)) \\ &= \epsilon\text{-closure}(4, 9) \quad \dots\dots B \end{aligned}$$

$$\begin{aligned} \text{Move}(C, b) &= \epsilon\text{-closure}(\text{Move}(C, b)) \\ &= \epsilon\text{-closure}(6) \quad \dots\dots C \end{aligned}$$

Move (D, a) = ϵ -closure (4, 9) B
 Move (D, b) = ϵ -closure (4, 11) E
 = {2,3,4,5,7,8,11,12,13,14,16,19}
 Move (E, a) = ϵ -closure (4,9,15) F
 = {2,3,4,5,7,8,9,13,14,15,16,18,19}
 Move (E, b) = ϵ -closure (6,17) G
 = {2,3,5,6,7,8,13,14,16,17,18,19}
 Move (F, a) = ϵ -closure (4,9,15) F
 Move (F, b) = ϵ -closure (6, 10, 17) H
 = {2,3,5,6,7,8,10,13,14,16,17,18,19}
 Move (G, a) = ϵ -closure (4,9,15) F
 Move (G, b) = ϵ -closure (6,17) G
 Move (H, a) = ϵ -closure (4,9,15) F
 Move (H, b) = ϵ -closure (6,11,17) I
 = {2,3,5,6,7,8,11,12,13,14,16,17,18,19}
 Move (I, a) = ϵ -closure (4,9,15) F
 Move (I, b) = ϵ -closure (6, 17) G

Since there is no new states, stop with this.

	a	b
→ A	B	C
B	B	D
D	B	E
* E	F	G
* F	F	H
* G	F	G
* H	F	I
* I	F	G

After eliminating duplicate states, the minimal DFA is as follows.

	a	b
→ AC	B	AC
B	B	D
D	B	EGI
* EGI	F	EGI
F	F	H
H	F	EGI

2. Explain in detail about the phases of compiler and translate the following statement, $pos := init + rate * 60$

Refer Chapter 1.3

3. Discuss any 4 compiler construction tools.

Refer Chapter 1.6

4. Write down the exclusive functions carried out by the analysis phases of any compiler.

Refer Chapter 1.2

5. Write briefly on the issues in input buffering and how they are handled.

Refer Chapter 1.8, 1.8.1
